解冲除域问题

• 请求拦截器/响应拦截器

```
import axios from 'axios';
let baseUrl = process.env.NODE_ENV !== 'production'?'http://localhost:8080':'/';
class AjaxRequest{
 constructor(){
this.baseURL = baseUrl; // 6#x914D;6#x7F6E;6#x9ED8;6#x8BA4;6#x8BEF;6#x5F84;
this.requestQueue = {}; // 6#x7F13;6#x5B58;6#x5F53;6#x524D;6#x8BF7;6#x6C42;6#x961F;6#x55C17;
6#x7528;6#x6765;6#x64CD;6#x4F5C;loading6#x7684;6#x663E;6#x793A;6#x6216;6#x8005;6#x9690;6#x85CF;
 configInterceptors(instance,url){
      console.log('显示loading');
          this.requestQueue[url] = config.url;
return config;
      // 配置响应拦截
      instance.interceptors.response.use(res=>{
    // 取消loading效果
          delete this.requestQueue[url];
if(Object.keys(this.requestQueue).length === 0){
              console.log('取消loading');
          if(res.status !== 200){
              return Promise.reject(res);
          }else{
             return res.data;
      })
  request(config){
      // 创 建 一 个 axios实 例
      let instance = axios.create();
      // axios(config);
config = {baseURL:this.baseURL,...config};
      this.configInterceptors(instance,config.url);
return instance(config);
export default new AjaxRequest();
```
